

4.4 Code Review Document - Blight-Blaze/Infinite-Dungeon-Beta

Dungeon.Java

Line 7: The line `(int)(Math.random()*(2))` would only produce 0 or 1 doors, so that I would change it to `(2)*(3)` so that there is a 1-3 chance of a door like the comment said.

Line 57: has a lot of code on it making it dense, I would break it into two separate named variables.

Line 65: All of the directions code are the same, but separated, I think you should combine all of the functions into one function

DugeonGame.java

Line 28: corrected spelling Inspiration

Line 65: There is a extra `System.out.println`.

- Instead of having all of these `system.out.print` lines I would put the names and roles into a array list that can then be printed more efficiently, then for the thanks section I would use a string `[] thanks = { "my family" etc...}` then I would use `system.out.print` to output the String person with the thanks

Line 154: I would talk a little bit more about the actions available, specifically TP

- Additionally The code is very long and I think could be made more concise instead of using a million `else{ }` if statements.
- Also when playing the game I defeated the monster, and went to each direction and every time it gave me a empty room, but when I tried to purchase the key from the store I did not have enough money. There is no way to get more money because no more monsters appear. Other than that this program is super good and seems like you spent a lot of time on it.

DungeonPlayer.java

Line 165-575: I am confused by what `//deprecated` means and the code that follows it, is this code necessary for your program?

Room.java

This room is concise and is error free!

RoomContents.java

Line 16: Instead of using the numbers 0-5 for actions/ things in a room use a constant for example: `Public static final int Entrance = -1` ect...

Code Review Reflection

This week, I reviewed a fellow student's final program. I learned a lot about how his program worked through running and playing the game. Coming into this assignment, I felt confident because in this class we had worked on debugging, and I had a lot of fun with those assignments. Once I started reviewing, I realized it is super hard to look at someone else's code and figure out what should be improved, because I don't know the reasoning behind each line. What I did to help me review this program was to take it line by line and play the game multiple times to better understand the function and use of each part of the code. Overall, I learned a lot about taking the review process slowly and analyzing the reasoning behind each line of code.
